# Additive Manufacturing Technologies

# History of Fused Deposition Modelling

- Created in 1988 by Scott and Lisa Crump (founders of Stratasys) Material Jetting
- Patented in 1989 as a technology for 3D printing where a material is extruded out of a nozzle and creates a 3D object layer by layer

# History of Fused Deposition Modelling

- FDM patent expired in 2009, igniting mainstream consumer 3D printing via the opensource RepRap project and startups like Ultimaker and Prusa
- Fused Filament Fabrication (FFF) was coined as an alternative to the trademarked term FDM

[www.reprap.org/wiki/Mendel](http://www.reprap.org/wiki/Mendel)

# How does FDM work?

# Motion system (gantry)

# Cartesian rectilinear: XZ-head

- Y-axis: buildplate
- X- and Z-axis: printhead
- Straightforward control
- Stepper motors for X-axis and extruder are moving
  - Heavy moving mass: slower printing
- Example: Prusa MK4

[www.prusa3d.com](http://www.prusa3d.com)

[www.reddit.com/r/mechanical\\_gifs/comments/87imzw/1st\\_print\\_on\\_prusa\\_i3\\_mk3/](https://www.reddit.com/r/mechanical_gifs/comments/87imzw/1st_print_on_prusa_i3_mk3/)

# Cartesian rectilinear: crossed

- Z-axis buildplate
- X- and Y-axis printhead
- External stepper motors for XYZ-axes and extruder (Bowden tube)
- Light printhead for faster printing
- Example: Ultimaker 2

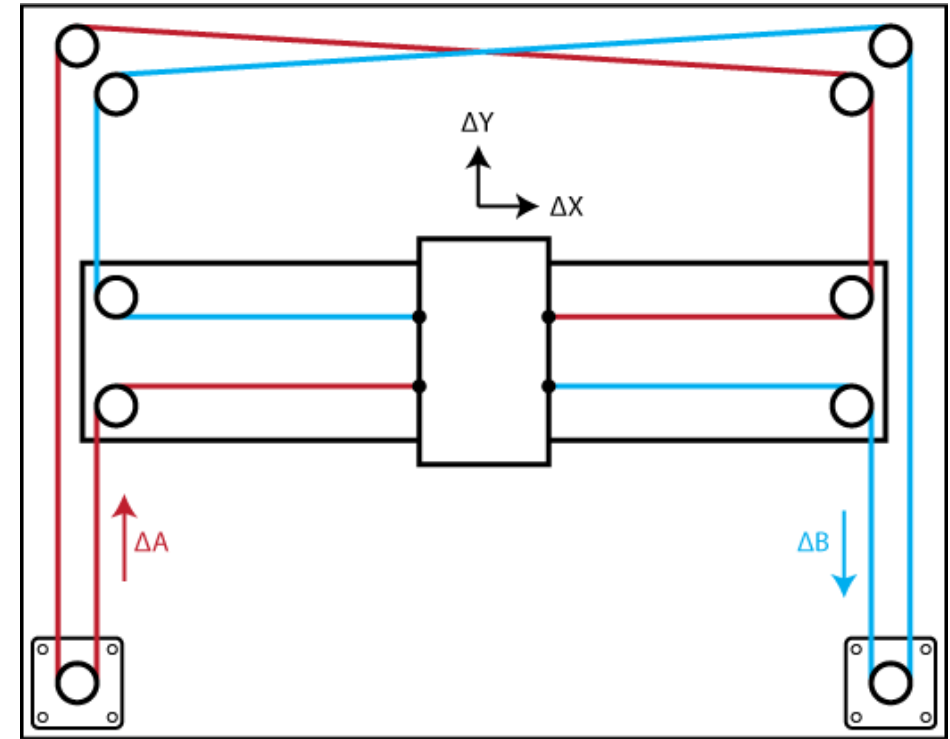

[www.mtb3d.com](http://www.mtb3d.com)

[www.makeagif.com/gif/wind-turbine-by-valcrow-ultimaker-3d-printing-timelapse-DAoPmJ](http://www.makeagif.com/gif/wind-turbine-by-valcrow-ultimaker-3d-printing-timelapse-DAoPmJ)

# Core-XY

- Both motors move clockwise:
  - carriage moves left
- Both motors move counterclockwise:
  - carriage moves right
- Both motors move in opposite directions:
  - up and down
- One motor moves:
  - diagonal
- Example: Bambu Lab X1

[www.corexy.com/theory.html](http://www.corexy.com/theory.html)

[www.3dprintbeginner.com/bambu-lab-x1-carbon-review/](http://www.3dprintbeginner.com/bambu-lab-x1-carbon-review/)

# Other types

## SCARA

<https://www.engineering.com/story/is-it-possible-to-sell-an-industrial-desktop-robot-for-under-2000>

## Polar

[www.makeagif.com/gif/polar-3d-printer-in-operation-eBs9yn](http://www.makeagif.com/gif/polar-3d-printer-in-operation-eBs9yn)

# Other types

## Conveyer belt

[www.3dnatives.com/en/creality-3dprintmill-conveyer-belt-231120204/](http://www.3dnatives.com/en/creality-3dprintmill-conveyer-belt-231120204/)

## Delta

[www.3dprint.com/75339/ares-all-in-one-3d-printer/](http://www.3dprint.com/75339/ares-all-in-one-3d-printer/)

# Other types

## Multi-axis (>3)

- Why would you want more than three axes for FDM?
- Printing orientation considerations

# Support material

- Cannot print in air
- Maximum overhang angle around 45 degrees
- More overhang requires a supporting structure

Overhang of less than 45 degrees  
No support is needed

Overhang of more than 45 degrees  
Support is needed

# Disadvantages of Support Material

- More material usage
- Non-smooth contact surface
- Post-processing required
- Extra printing time

<https://support.makerbot.com/s/article/1667411595840>

# Internal Support: Infill

- Printing solid parts is slow
- Print internal structure for support, strength, and weight

# Surface Quality

- Stair-stepping effect

# Anisotropic properties

- Mechanical properties are different along each axis
- Strength/stiffness larger in the direction of the fibers
- Bonding between layers is weaker

# Advantages of multi-axis Additive Manufacturing?

- Support-free printing
- Strength enhancement
- Better surface quality

# Materials

# Filament

- Thermoplastics of 1.75mm or 2.85mm in diameter
- Most printers use 1.75mm filament
  - Less torque required
  - less power required to heat the filament
- Some printers (e.g. Ultimaker) use 2.85mm filament
  - Why?

<https://www.ankermake.com/blogs/printing-tips/how-to-dry-filament>

# Answer

- Pushing filament through the Bowden tube

[www.support.makerbot.com/s/article/1667337580379](http://www.support.makerbot.com/s/article/1667337580379)

# Polylactic acid (PLA) filament

- Made from fermented plant starch from corn, cassava, maize, sugarcane or sugar beet pulp
- Low melting temperature (170-180 °C)
- Easy to print
- Low hardness and toughness
- Inexpensive
- Made from renewable materials
- Compostable
- Lower carbon footprint

# Engineering plastics

- PEEK (PolyEtherEtherKetone)
- ABS (Acrylonitrile Butadiene Styrene)
- PP (PolyPropylene)
- PETG (PolyEthylene Terephthalate Glycol)
- And many others...

# Flexible materials

- TPU (thermoplastic polyurethane)
- Shore hardness typically in the range of 50A-95A

[www.3dnatives.com/en/tpu-3d-printing-040620204/](http://www.3dnatives.com/en/tpu-3d-printing-040620204/)

# Which printer is better for flexible materials?

[www.tomsguide.com/us/ultimaker-2-3d-printer,review-2556.html](http://www.tomsguide.com/us/ultimaker-2-3d-printer,review-2556.html)

[www.prusa3d.com](http://www.prusa3d.com)

# Answer

- Friction when pushing a flexible filament through the bowden tube leads to underextrusion
- Direct-drive extruder better for 3D printing flexible materials

[www.support.makerbot.com/s/article/1667337580379](http://www.support.makerbot.com/s/article/1667337580379)

# Support material

- PVA (polyvinyl alcohol): dissolves in water
- HIPS (high impact polystyrene): dissolves in limonene
- Dual extrusion required

# Special filaments

- Magnetic
- Conductive
- Ceramic-filled
- Metal-filled
- Glow-in-the-dark
- Glitter
- Color-changing
- PoroLay
- Ultrafuse
- And many more...

[www.cnckitchen.com/blog/which-glow-in-the-dark-filament-is-the-best](http://www.cnckitchen.com/blog/which-glow-in-the-dark-filament-is-the-best)

 **UltiMaker**  
3D print functional steel parts

# Fiber-reinforced composites

- Carbon fiber
- Aramid fiber
- Fiberglass

The background image shows a close-up of a continuous carbon fiber reinforcement process. A blue resin bath is visible, with a fiber being pulled through it. The fiber is then being wound onto a spool. The image is dark, with the blue resin bath providing a strong contrast. A yellow line runs diagonally across the bottom right of the image.

PROCESS EXPLANATION

# How Continuous Carbon Fiber Reinforcement Works

Markforged

# Non-filaments

- Granular plastic (pellet printers)
- Paste extrusion
- Silicone/Glass/Concrete

<https://3dprinting.com/news/transform-your-3d-printer-into-a-versatile-paste-extrusion-add-on/>

# Temperature management

- Nozzle
- Heated bed/chamber
- Fan

# Issues related to temperature management

- Delamination
- Warping
- Oozing/stringing
- Pillowing
- Underextrusion
- Overextrusion
- Nozzle clogging
- And many others...

# Delamination

- Poor layer-to-layer adhesion
- Increase the nozzle temperature
- Decrease the printing speed

[www.facfox.com/docs/kb/5-tips-to-avoid-layer-delamination-in-3d-printing](http://www.facfox.com/docs/kb/5-tips-to-avoid-layer-delamination-in-3d-printing)

# Pillowing

- Warping around infill structure
- Too hot: turn on fan for the top layers

[www.all3dp.com/2/3d-printing-top-layer-problems-easy-fixes-for-pillowing/](http://www.all3dp.com/2/3d-printing-top-layer-problems-easy-fixes-for-pillowing/)

# Warping

- Uneven cooling and thus shrinking of extruded filament
- Solutions?

[www.simplify3d.com/resources/print-quality-troubleshooting/warping/](http://www.simplify3d.com/resources/print-quality-troubleshooting/warping/)

# Warping: solutions

- Heated bed/enclosure
- Fan off
- Use low-temperature materials
- Print slow (~35mm/s)
- Reduce infill density
- Use a brim/raft/adhesive
- Avoid sharp corners (prone to uneven cooling)

[www.stampa3d-forum.it/articoli/guide/skirt-brim-raft-cosa-sono/](http://www.stampa3d-forum.it/articoli/guide/skirt-brim-raft-cosa-sono/)

# Raft

- Horizontal latticework of filament located underneath your part
- Delamination as a feature

# Oozing/stringing

- Plastic oozing out of the nozzle when the extruder is moving to a new location
- Solutions?

[https://help.prusa3d.com/article/stringing-and-oozing\\_1805](https://help.prusa3d.com/article/stringing-and-oozing_1805)

# Oozing/stringing: solutions

- Retraction of the filament during travelling
  - Not possible for soft filaments
- Reduce travelling of the nozzle without printing

# Solving printing issues

- Change hardware settings
- Change the printing strategy
- Change the CAD model

[www.sculpteo.com/blog/2018/07/16/mastering-fdm-3d-printing-in-your-school-lab/](http://www.sculpteo.com/blog/2018/07/16/mastering-fdm-3d-printing-in-your-school-lab/)

# Slicer settings

# Converting an STL-file into a G-code file

- Instructing machine tool movement to fabricate a model
  - G-code
- Slicer software
  - Cura
  - Bambu Studio

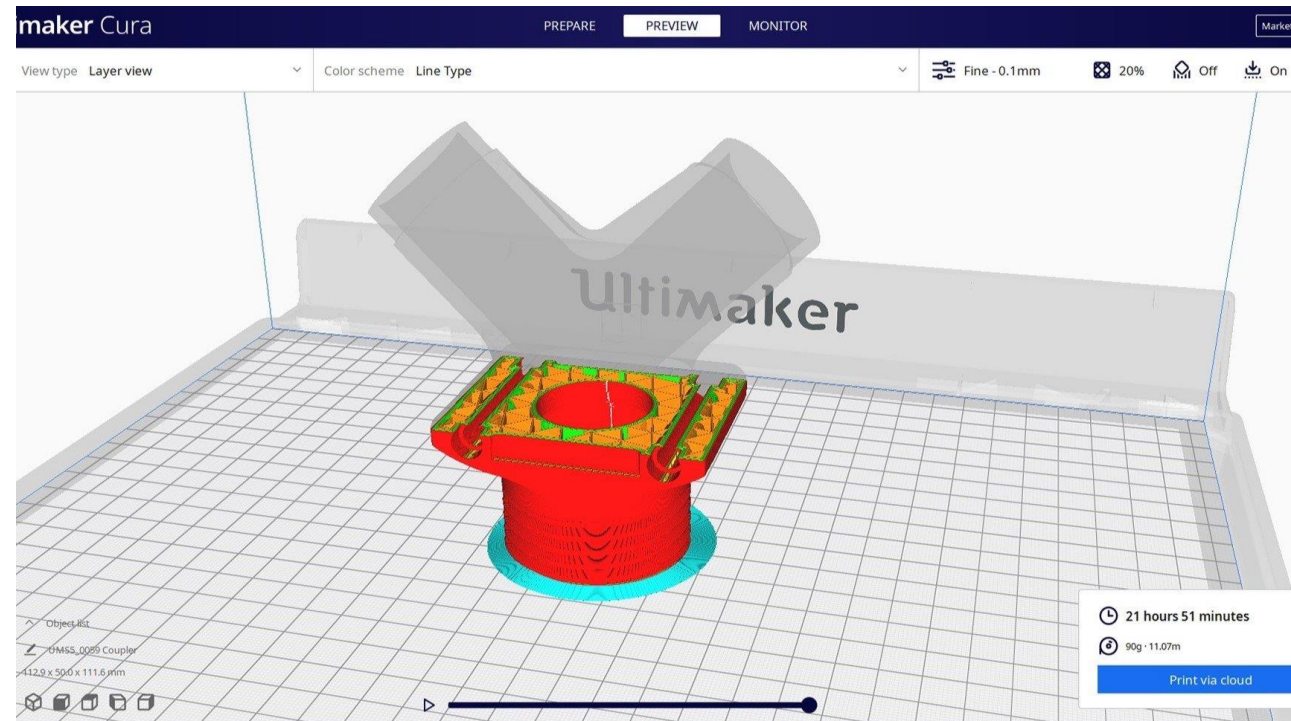

[www.all3dp.com/2/best-cura-plugins/](http://www.all3dp.com/2/best-cura-plugins/)

# Decisions made in the slicer

- Orientation
  - Affects strength
  - Affects printing time
  - Affects surface quality
  - Affects the amount of support material required
- Support structure/infill
- Path planning

[www.all3dp.com/2/best-cura-plugins/](http://www.all3dp.com/2/best-cura-plugins/)

# G-code

- Computer numerical control programming language
- Originally used for CNC milling machines
- Developed by MIT in the 1950s
- Now the standard for 3D-printing

The diagram shows a block of G-code with several parameters highlighted by colored boxes and labeled with arrows:

- Fan speed setting:** Points to the `M107` command (green box).
- Nozzle travel speed (without extrusion):** Points to the `F9000` parameter in the `G0` command (red box).
- Nozzle printing speed (with extrusion):** Points to the `F2340` parameter in the `G1` command (red box).
- Layer height:** Points to the `Z0.300` parameter (blue box).
- Extrusion length:** Points to the `E0.18815` parameter (orange box).
- X, Y Coordinates:** Points to the `X57.299 Y55.078` parameters in the `G1` command (blue box).

```
;Layer count: 25
;LAYER:0
M107
G0 F9000 X52.235 Y55.800 Z0.300
;TYPE:SKIRT
G1 F2340 X56.093 Y55.800 E0.18815
G1 X56.346 Y55.605 E0.20373
G1 X57.299 Y55.078 E0.25684
G1 X58.540 Y54.758 E0.31934
G1 X59.404 Y54.719 E0.36152
G1 X60.320 Y53.688 E0.42878
```

# Unconventional printing modes

- Push the boundaries of FDM printer's capabilities
- Understanding of the hardware enables new possibilities

# Bridging

- Span a line across a gap
- Cura feature

[www.3dnatives.com/en/how-to-avoid-bridging-in-3d-printing-2107234/](http://www.3dnatives.com/en/how-to-avoid-bridging-in-3d-printing-2107234/)

# Wire printing

- Solidify mid-air
- Print slow with fan on
- Cura feature

A close-up photograph of a 3D printer's extruder head positioned above a partially completed red mesh object. The object has a complex, woven or lattice-like structure. The printer's nozzle is visible at the top, and the background is a plain, light-colored surface.

**WIRE  
PRINTING**

# Fuzzy skin

- Jitter the printhead on the outer contour
- For a rough surface and hiding layer lines
- Cura feature

[www.reddit.com/r/3Dprinting/comments/arrhnl/so\\_i\\_tried\\_curas\\_fuzzy\\_skin\\_mode\\_yeahits\\_like/](https://www.reddit.com/r/3Dprinting/comments/arrhnl/so_i_tried_curas_fuzzy_skin_mode_yeahits_like/)

# Ironing

- Moving the nozzle back and forth over the top layer
- Small amount of extrusion to fill gaps
- Cura feature

[www.youtube.com/watch?app=desktop&v=gh5wC4Ti95s&ab\\_channel=CHEP](http://www.youtube.com/watch?app=desktop&v=gh5wC4Ti95s&ab_channel=CHEP)

**SMOOTH**

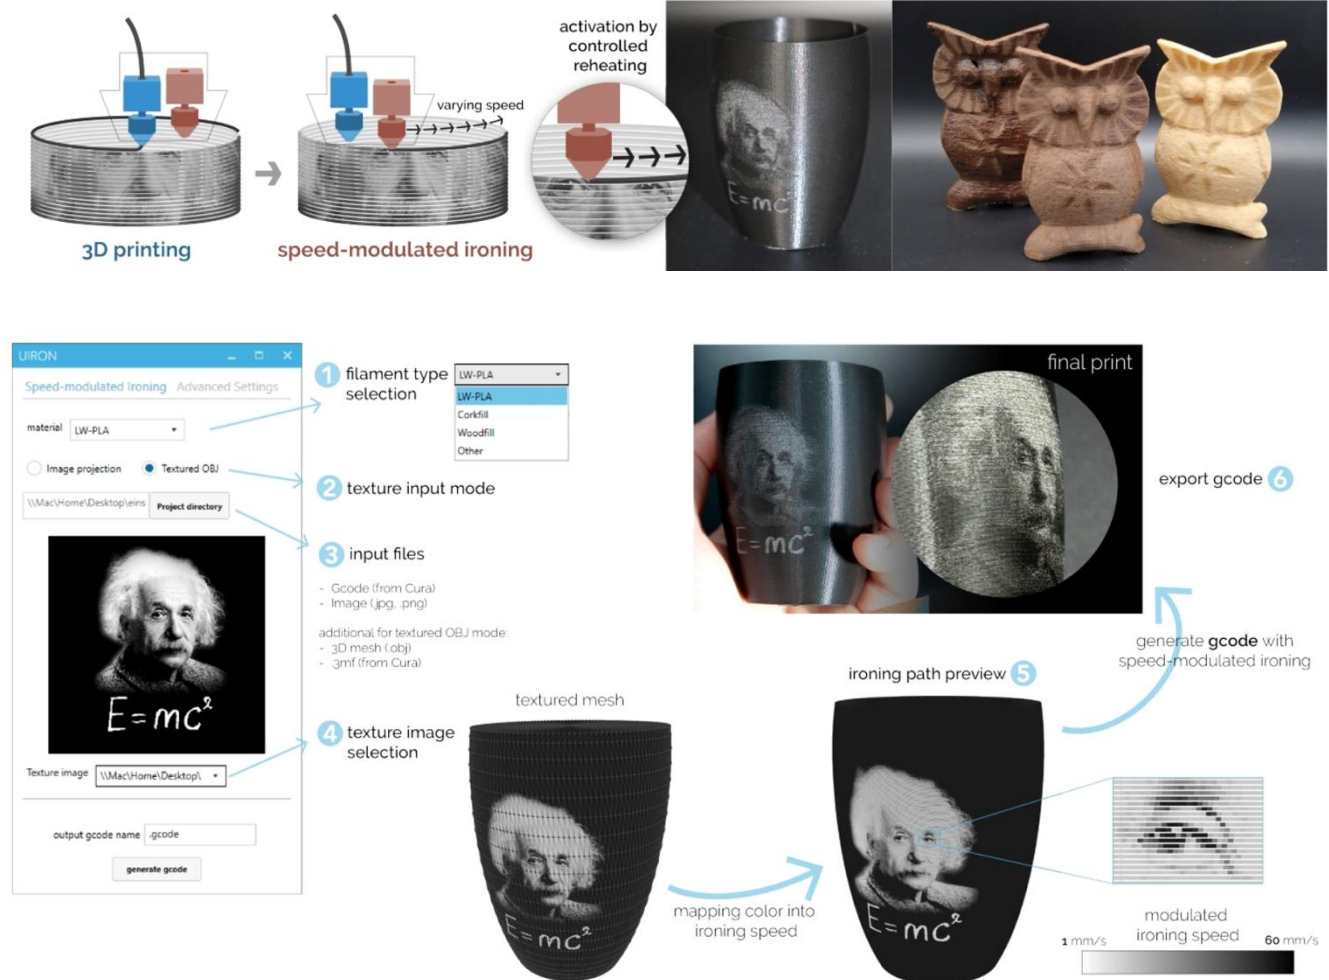

**Textured**

---

# Speed-modulated Ironing

- One nozzle to 3D print and a second nozzle to reheat printed areas at varying speeds, controlling the material's temperature-response
- The rapid adjustments of speed allow for fine-grained reheating, enabling high-resolution color and texture variations

Demonstrating Speed-Modulated Ironing: High-Resolution Shade and Texture Gradients in Single-Material 3D Printing, Ozdemir et al., 2024

with **varying speeds** of ironing  
we achieve fine-grained **control of heat**

**speed-modulated  
ironing**

# Sagging

- Print black and white layers in an alternating way
- Hatching for halftoning (simulating continuous tone)

Hatching for 3D prints, Kuipers et al., 2017

# Drooping

# Injection

# Rope coiling

# Other extrusion modes

- Spaghetification
- Mid-air printing
- Fusing
- Laying
- Blobbing
- Piling
- Underextrusion
- Engraving
- And many more...

# Post-processing

# Post-processing

- Support removal
- Sanding
- Smoothing
- Drilling
- Painting
- Polishing
- Hydro-dipping
- Electroplating
- Epoxy coating
- Welding
- And many more...

<https://manufactur3dmag.com/8-techniques-for-post-processing-of-fdm-3d-printed-parts/>

# Smoothing

- Acrylonitrile Butadiene Styrene (ABS)
  - ABS is soluble in ketones
  - Acetone can be used to smoothen part
  - Difficult to print (warping)
- Polyvinyl butyral (PVB)
  - Easier to print
  - Put in mist of IPA to smoothen part

<https://www.geeetech.com/blog/2018/02/heres-how-you-can-get-smooth-and-shiny-abs-prints-at-home/>

# Where does design end?
